

1 A real UAV block

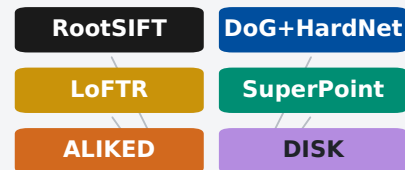

D1, 154 images, convergent

stations and optical axes, grey where near-nadir,
over the orthophoto and surface model;
the pair of step 3 in yellow

2 One fixed protocol

only the matching method changes

same candidate pairs

1937 in D1, 1217 in D2

same geometric verification

MAGSAC++, 2 px threshold

same bundle adjustment

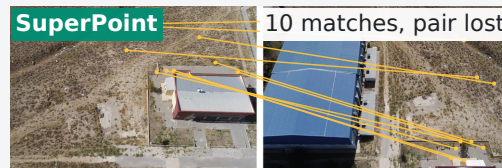

COLMAP, one camera model

compared with the reference

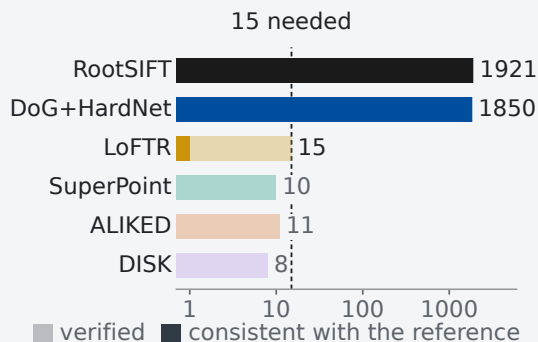

camera centres, epipolar
geometry, delivered surface

3 One pair, $\theta = 41^\circ$

viewing directions 41° apart, 25 m baseline

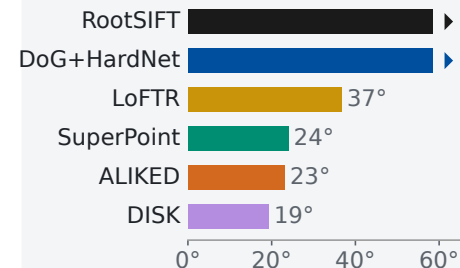

correspondences in this pair

4 Whole blocks

every candidate pair, every run

D1, half of the pairs lost at θ

arrow: half never lost up to 61°

range over detector-based runs
